

Nonverbal Communication And Marital Interaction

Amy G. Halberstadt, Alison E. Parker, and Vanessa L. Castro

5 Nonverbal communication: developmental perspectives

Abstract: This review examines how nonverbal communication develops throughout the lifespan. The Affective Social Competence (ASC) model guides our review of research investigating how the abilities to receive and send both spontaneous and posed nonverbal messages develop throughout the lifespan, and across multiple channels. As part of this review, we attempt to illustrate how development of such skills from infancy to older adulthood is complex, multidynamic, contextual, and occasionally dependent upon other social cognitive milestones and motivations. Receiving and sending appear to be lifespan projects, with skills and styles developing well into adulthood, and few deficits occurring in later adulthood. Receiving and sending and their developmental processes appear to be related to temperament, gender, family socialization, and cultural values and norms. They also vary substantially by context and relationship, and predict a number of important socio-emotional outcomes. In addition to summarizing findings in the literature, we highlight gaps in our knowledge and generate areas for future research throughout the chapter.

Keywords: nonverbal communication, decoding, spontaneous expression, encoding, lifespan development, infancy, adulthood, aging, family expressiveness, culture

1 Introduction

1.1 Guiding beliefs

Research on nonverbal communication has been largely conducted "within" age groups, yet putting the studies together in age-related order, as in this review, allows us to better connect the dots. In this chapter, three guiding principles in development influence our thinking and recommendations for future research. First, we recognize nonverbal communications as processes which themselves are embedded in the process of development. Second, individuals themselves are complex, multidynamic systems, and their developing cognitive, physical, social, and emotion regulatory skills are likely intertwined with the development of their nonverbal abilities. Third, individuals reside within many social contexts, including family, neighborhood, and cultural contexts, and these contexts impact how individuals interpret others and create their own behaviors within these various lenses.
